Risk Shadowing Review - Sample Evidence Pack

Illustrative output structure for a Risk Shadowing Review. Synthetic example for analyst and compliance walkthroughs.

This example uses synthetic data only and is provided to illustrate the structure of Verafye's Risk Shadowing outputs. All entities, identifiers, counts, and relationships are fabricated. Nothing here represents a real customer, transaction, or confirmed finding.

A · REVIEW SUMMARY

Case ID	RS-2026-014	Review Type	Risk Shadowing Review
Use Case	Mule-linked merchant and beneficiary network	Segment	PSP / PayFac / BaaS ecosystem
Data Scope	Controlled historical sample	Review Period	Synthetic 14-day window
Output Type	Investigation-ready evidence pack	Status	Analyst review recommended

Verafye identified a linked risk cluster across multiple merchants, wallets, beneficiaries, device fingerprints, and payment events. The cluster showed repeated beneficiary reuse, shared device patterns, overlapping KYC attributes, and structured transaction behavior across entities that were previously reviewed as separate alerts.

B · INPUT SIGNALS ANALYZED

Synthetic sample counts.

42

existing alerts

318

payment events

9

merchants / sub-merchants

27

wallet or account identifiers

14

beneficiaries

6

anonymized device fingerprints

3

prior case references

2

program-level identifiers

1

sponsor-bank review tag

C · NETWORK RISK FINDING

Verafye detected that several alerts previously treated as separate events were linked through shared beneficiaries, repeated device fingerprints, similar KYB attributes, overlapping payout timing, and circular payment behavior.

- Merchant A and Merchant C share Beneficiary B-204
- Wallet 1042 and Wallet 1189 share Device Hash D-91F3
- Merchant B and Program Alpha show repeated payout timing patterns
- Beneficiary B-204 appears across four unrelated alert events
- Account Cluster 17 shows repeated low-value structuring behavior
- Prior Case C-077 links to the same beneficiary and device pattern

D · GRAPH-LINKED ENTITY VIEW

E · RISK INDICATORS

Indicator	Synthetic observation	Why it matters	Suggested review action
Shared beneficiary across unrelated merchants	Beneficiary B-204 across Merchant A and Merchant C	May indicate coordinated payout consolidation	Review beneficiary linkage across merchants
Device reuse across multiple wallets	Device Hash D-91F3 on Wallet 1042 and Wallet 1189	Suggests shared control of accounts	Validate device across related sessions
Structured low-value transactions	Account Cluster 17 repeated low-value activity	May indicate structuring behavior	Review transaction sequencing
Repeated payout timing	Merchant B and Program Alpha aligned timing	Suggests coordinated activity	Review payout schedules for the cluster
KYB metadata overlap	Overlapping onboarding attributes	May indicate linked ownership or control	Review onboarding and ownership records
Prior case linkage	Prior Case C-077 shares beneficiary and device	Connects current cluster to past review	Compare prior case with current cluster
Cross-program recurrence	Pattern recurs across program-level identifiers	May indicate cross-program network risk	Review activity across programs
Unusual counterparty concentration	Concentrated counterparties around B-204	Suggests narrow payout network	Review counterparty concentration
Alert clustering across fraud and AML rules	42 alerts cluster across rule types	Linked activity may span fraud and AML	Joint fraud and AML review
Linked activity outside a single provider view	Linkage spans providers and programs	Single-system view may miss the network	Review connected, cross-provider context

F · RISK NARRATIVE

Viewed individually, the alerts appeared to involve separate merchants and wallets. When connected through Verafye's graph-native intelligence layer, the activity formed a linked network involving shared beneficiaries, repeated device patterns, overlapping KYB attributes, and recurring payment timing. The evidence may indicate a connected network and suggests review. The cluster should be reviewed as a connected network case rather than separate low-priority alerts, and requires analyst validation. Recommended for investigation.

G · CASE-READY EVIDENCE PACK

- ✓ Cluster summary
- ✓ Linked entity list
- ✓ Relationship map
- ✓ Alert-to-case grouping
- ✓ Risk indicators
- ✓ Supporting payment events
- ✓ KYC / KYB linkage summary
- ✓ Device and identity linkage summary
- ✓ Prior case references
- ✓ Analyst notes
- ✓ Recommended review steps
- ✓ Audit-ready decision summary

H · ANALYST REVIEW NOTES

- Review Beneficiary B-204 across all linked merchants and wallets.
- Validate whether Merchant A, Merchant B, and Merchant C share ownership, control, or onboarding attributes.
- Review Device Hash D-91F3 across related wallets and sessions.
- Compare Prior Case C-077 with current cluster RS-2026-014.
- Escalate for enhanced review if ownership, beneficiary, or device linkage is confirmed.

I · AUDIT-READY DECISION SUPPORT

Recommended disposition	Enhanced review recommended
Confidence direction	Network linkage observed, analyst validation required
Suggested escalation	Fraud and AML joint review
Evidence basis	Shared beneficiary, shared device, KYB overlap, payment timing, prior case link
Documentation status	Case-ready summary available
Next action	Validate linked entities and determine whether escalation, monitoring, filing review, or customer outreach is required

Filing review may be considered based on institution policy and analyst validation.

J · WHAT THIS DEMONSTRATES

This synthetic example shows how Verafye can help teams move from fragmented alerts to connected investigation context. A Risk Shadowing Review can reveal linked entities, suspicious clusters, repeated identifiers, beneficiary reuse, device patterns, and case relationships that may not be visible inside a single system or provider view.

- Connects alerts into case-ready clusters
- Detects hidden network relationships
- Helps analysts see entity, device, merchant, beneficiary, and payment linkages
- Produces evidence packs for review
- Supports explainable, audit-ready decisions
- Lets teams validate value before deeper deployment

Verafye - Network Risk Intelligence. Internal sales asset. Synthetic data only. Verafye is designed to support fraud and AML investigation workflows alongside existing systems. We do not claim regulatory approval, certification, or guaranteed fraud prevention. Not for public distribution.
